Senegal

Malaria in Senegal:

Transmission occurs throughout the country, with all of Senegal's almost 12 million residents living in malaria-endemic areas.

The Booster Response:

Senegal benefits from substantial support from the Global Fund to Fight AIDS, TB, and Malaria, which has particularly supported the shift to artemisinin-based combination therapies. Insecticide-treated bednet coverage, however, remains less than 10%. The Booster Program support is a US\$5 million addition to a US\$10 million Nutrition Enhancement Project, with a primary focus on distribution of long-lasting insecticide treated bednets through community groups. In addition, as part of the Senegal River Basin Water Resources Development Project, the Senegalese population living in the river basin will also benefit from long-lasting insecticide-treated bednets.
