HIV/AIDS in Transport Sector Impact, Global Experiences in the Response and the Role of Transport Sector in China

Dr. Wiwat Rojanapithayakorn
HIV/AIDS Team Leader
WHO China
HIV/AIDS: a current major public health problem in the world

- Over 38 million people are living with HIV/AIDS
- A major threat to public health & economic development
- Effects at various levels (household, community, sectoral and national)

Source: UNAIDS slide
Transport sector include:

- Trade, Tourism and Transport
- Air transport, railway, water transport and road
- Goods, labor, and tourists moving in large numbers
- Migrant workers, construction workers, truck drivers and helpers, sex workers
HIV/AIDS in Transport Sector

- People at high risk and their families include
  - Construction workers
  - Employees who maintain infrastructure
  - Workers in railways, roads, airlines
  - Professionals engaged in maintenance
  - Population living along roads, highways and tourist destinations.
  - Sex workers
  - Mobile and migrant populations
Transport and spread of HIV/AIDS

• Transport is major vector for HIV spreading:
  – Movement of people
  – Behaviors associated with transport sector workers and transportation hubs
Transport and spread of HIV/AIDS

- In many developing countries, the first populations found to be affected by the virus were those living and working along truck routes.
- Researchers following trends in the HIV epidemic, particularly of the developing world, noticed that the virus traveled from high- to low-prevalence areas along the same routes that trucks traveled.
- Changes in prevalence were also documented from urban to rural areas along truck routes.
Transport and spread of HIV/AIDS

- HIV transmission was discovered along truck routes from Zambia, Zimbabwe, Malawi, and Mozambique to South Africa
Transport and spread of HIV/AIDS

42% of truck drivers report indulging in commercial sex while traveling; 33% of those who have casual sex don’t use condoms
Survey results, Poland and Lithuania border areas (World Bank, 2003)

Truck drivers (and assistants) were known to have unprotected sex with multiple sex workers during their travels.
Transport and spread of HIV/AIDS

• For Kenyans, 19% of drivers tested positive for HIV compared to 3% of the general group.
• For Ugandans, 36% of drivers tested positive compared to 15% of the general group.
• For Rwandans, 51% of the drivers tested positive vs. 21% of the general group.
Transport and spread of HIV/AIDS

- Truckers have high rates of STIs and HIV. A recent study of 320 male truckers in South Africa found that 56% were HIV-positive and 60% reported having had a different STI in the previous six months.

- While the percentages are smaller in Asia and Latin America, where the epidemic started later, the numbers are growing rapidly.

- India, the number of truck drivers who are HIV positive increased by about 30% between 1997 and 1999.

Source: The Synergy Project and University of Washington. Putting on the brakes. Preventing HIV transmission along truck routes.
Transport and spread of HIV/AIDS

• In Bangladesh, a national surveillance study found that the people with the highest prevalence of HIV were sex workers, long-distance truck drivers, people who had a history of sexually transmitted infections, and sailors.

• A study of truckers in China found that the rates of chlamydia and gonorrhea were 10.2% and 7.8% respectively, compared with 5.6% and 1.9% for the general population.

Source: The Synergy Project and University of Washington. Putting on the brakes. Preventing HIV transmission along truck routes.
Transport and spread of HIV/AIDS

- The risk behaviors observed among truck driver and assistants are observed in other populations within the transport sector: construction workers, workers in railways, roads, airlines, mobile and migrant populations, tourists.

- There are groups of population bridging the HIV virus from the transport sector groups to the general public: population living along roads, highways and tourist destinations, sex workers.
### HIV Prevalence prior to and post construction/improvement transport corridors

Impact of HIV/AIDS on the Transport Sector

• Reduction in labor supply: loss of young adults who are most productive people in the society. This affects the overall economic output.
• Increased costs:
  • Direct cost particularly on expenditures incurred for medical care, drugs and funeral costs.
  • Indirect cost, which includes among others, loss of time to illness, recruitment as well as training costs of replacing new workers and care of orphans.
Impact of HIV/AIDS on the Transport Sector

The economic impact of HIV/AIDS in Tanzania Railway Authority

• Medical costs for Tanzania – Zambia Railway Authority (TAZARA) workers associated with HIV/AIDS-related illness increased over a one-year time frame from Tshs 2.8 million in January to Tshs 2.6 Million in December. This is a 63% increase.

• Funeral costs increased from Tshs 1.3 Million in 1988/89 to Tshs 5.8 million in 1992/93. The report indicates that 50% of all deaths were due to HIV/AIDS.

• Generally the organizations are losing employees at the rate of 0.5 – 1.5% every year due to AIDS-related diseases.

HIV Prevention in the Transport Sector
HIV Prevention in the Transport Sector

• HIV prevention efforts designed for specific occupational groups, often targeting the purchase of sex while on the road, have met with considerable success.
• There is ample evidence that HIV prevention programmes aimed at truck drivers can reduce their frequency of unprotected sex.
HIV Prevention in the Transport Sector

• In Tamil Nadu, research carried out after an HIV prevention programme for truck drivers found the percentage of drivers reporting that they had had commercial sex declined from 14% in 1996 to 2% in 2003.
• Moreover, the percentage of drivers whose last instance of commercial sex was unprotected fell from 45% to 9% in the same period.
HIV Prevention in the Transport Sector

- Programmes targeting truck drivers are most effective if carried out with the agreement of both employers and employees.
- In South Africa, an agreement between representatives of workers and employers has led to the establishment of a network of roadside clinics that provide general health services and HIV prevention interventions.
HIV Prevention in the Transport Sector

- In Malawi, the World Food Programme is in partnership with private companies, non-governmental organizations and the government to provide HIV prevention information, condoms, treatment of sexually transmitted infections, voluntary HIV counselling and testing and referrals for HIV treatment to truck drivers and sex workers in two locations in the country.
HIV Prevention in the Transport Sector

Projects that aim to reduce HIV transmission in transport sector should consider including the following components:

1. Targeted communication efforts to promote supportive and reinforcing environments for behavior change, including peer education;
2. Condom promotion, including social marketing;
3. Condom provision, including female and male condoms;
4. STI treatment services, including targeted presumptive treatment;
5. Workplace interventions;
6. Active community involvement;
7. Advocacy with policy makers, government institutions, and transport business companies.
HIV Prevention in the Transport Sector

Stakeholders within transport sector

- Government, as represented by ministries of transportation and commerce;
- Trucking companies – local, national, or international;
- Trucking associations, trade unions, and training institutions;
- Health providers (treating STIs and other illnesses);
- Community members.
China: the Role of Transport Sector in HIV Prevention
China’s HIV/AIDS Situation

~0.05% overall HIV prevalence

~650,000 people living with HIV/AIDS (range: 540,000 to 760,000)

~75,000 people with clinical AIDS

~25,000 AIDS deaths

~70,000 new HIV infections
China’s Major HIV/AIDS Challenges

- Continuous increases in HIV incidence (new cases) and prevalence (living cases)
- Risk of spread from groups at high risk to the general population via sex
- Barriers to reversing the epidemic:
  - Low coverage of interventions
  - Inadequate quality of services delivery
Large Populations at Risk of HIV

- 30 to 50 million people at risk of HIV (2005 estimate)
  - Large population of drug users, high levels of drug injection and needle/syringe sharing
    - Number of ‘registered’ drug users: 1.14 million
    - Estimated number much higher: 1.8 to 2.9 million
  - Growing sex industry and sexual revolution, low levels of condom use
    - Number of ‘registered’ sex workers: ~0.9 million
    - Estimated number of sex workers: 2.8 to 4.5 million
    - Estimated number of clients of sex workers: 10+ million
    - Estimated number of men who have sex with men: 5-10 million
- Larger social trends: rises in migration, premarital sex, and sexually transmitted infections (STIs)
China: vulnerability and risk factors

- Low awareness of AIDS among the general public
- Low condom use
- Mobility and migration
- High prevalence of narcotic drug use
- Wide availability and affordability of commercial sex
- Limited access to prevention and care services for people at risk
- IEC and awareness raising but less emphasis on behaviour change strategies
Mobility in China

• Most of the major cities in China are tourist destination, and millions of tourists come to these cities- both domestic and national.

• There are 126,000 operational vehicles in Guangxi, including 26,000 buses with 500,500 seats and 100,000 trucks. As many as 10 million people are directly or indirectly involved in the transportation sector of Guangxi.
China Transport system

- China has 486 airports
- Over 74,000 km railways, one of the largest in the world
- Over 1,800,000 km roadways, and at least 29,745 km of expressways
- 123,000 km waterways
- 7 major ports (Dalian, Guangzhou, Nanjing, Ningbo, Qingdao, Qinhuaungdao, Shanghai)
China: Role of Transport Sector in HIV Prevention

Government main stakeholders:

- Ministry of Communication
- Ministry of Railways
- Bureau of Aviation

All three organizations are the members of the State Council AIDS Working Committee
China: Role of Transport Sector in HIV Prevention

The main activities include:

• Workplace programmes

• Campaigns to raise public awareness: AIDS awareness message boards at the airports (18) and public places within the transport system
China: Role of Transport Sector in HIV Prevention

More roles are needed within the sector:
- Advocacy;
- Participation and involvement of private sector
- Behavioral change communications targeting workers and clients of the transport business;
- Workplace interventions;
- Condom promotion, including condom distribution;
- Mobilization of resource for HIV prevention and care;
- Increased coverage and quality of interventions
Sex Workers: an important mobile population group
Sex Work in China

1. DIRECT SEX WORKERS
   • Brothel-like

2. INDIRECT SEX WORKERS
   • Estimated at between 2.8 to 4.5 million in China
   • Higher risk of introducing infection into an area
   • Easier to identify and access
   • Bars, Nightclubs, Massage Parlors, Karaoke Lounges, Beauty Parlors, Saunas…

3. FREELANCE SEX WORKERS
   • Work on street (organized or self-employed)
   • Relatively small population, but at highest risk
   • Not easy to access and cover for intervention
China: HIV Prevalence among Sex Workers, 1995-2004
The 100% Condom Use Programme (CUP) is a programme to prevent sexual transmission of HIV in the general population by ensuring high level of condom use among sex workers and their clients.
Number of STI Cases, 1970-2001, and Condom Use Rate in Sex Establishments
