Understanding Creative Destruction: Implications for Labor Markets

John Giles

DECHD
Overview

- Healthy, market economies are dynamic
  - High pace of output and input reallocation
  - Churning of firms, jobs and workers is productivity enhancing
    - Market selection yields exit of less productive firms and establishments
  - Young and small businesses play a fundamental role in these dynamics
  - Young and small businesses have higher than average net growth rates and are much more volatile than large and mature businesses
  - Uncertainty, experimentation, learning and selection play an important role
    - These factors important both for advanced economies at technology frontier as well as emerging and transition economies
- Firm dynamics and worker outcomes closely linked
- Recent events remind us that healthy dynamism requires well functioning markets (including credit markets)
Motivating Questions

- What factors impact these dynamics?
- How do these dynamics differ across advanced, emerging and transition economies?
- What is the role of self-employment and the informal economy in these dynamics?
  - Can we learn anything about these questions from advanced economies?
- What are the implications for market structure and institutions?
  - Flexibility + Safety Net
  - What is optimal mix?
  - Does one size fit all?
- What can go wrong?
  - Creative Destruction during Crises
Evidence from U.S., Advanced, and Transition Economies

- U.S.: Longitudinal Business Database (LBD) for all employer businesses and ILBD which adds all nonemployer (e.g., sole proprietors without employees)
  - http://www.ces.census.gov/index.php/bds/bds_home

- WB firm level data project: Firm Dynamics for advanced, emerging and transition economies

- Specific country studies: E.g., Colombia, Indonesia
Share of Establishments by Firm Size, 2005

- Micro Firms (1-9 employees), 3,956,622
- Small-Medium (10-500 employees), 1,669,297
- Large Firms (500+ employees), 1,030,481
Share of Employment by Firm Size, 2005

- Micro Firms (1-9 employees), 13,332,034
- Small-Medium (10-500 employees), 46,147,894
- Large Firms (500+ employees), 56,374,911

Main Messages

- Creative Destruction ubiquitous feature of U.S. (and other healthy market economies)
  - Large Magnitude
  - Creation in Recessions, Destruction in Booms
  - Idiosyncratic Effects (Difficult to Pick Winners)
    - Young, small businesses “Up or Out”
  - Productivity Enhancing

- No free lunch
  - Costly for firms and workers
  - Breakdowns in the process?
    - Collapse of Financial Markets?
  - But evidence clearly shows distorting process can have adverse consequences on allocative efficiency
Evidence shows pace of reallocation rose over course of 1990s for transition economies

However, impact of market distortions and poor institutions appears to work more systematically on the nature and productivity of reallocation

Aggregate productivity and allocation

- Olley and Pakes (1996) static decomposition:

\[ P_t = \frac{1}{N_t} \sum_i p_{it} + \sum_i (\theta_{it} - \bar{\theta}_t)(p_{it} - \bar{P}_t) \]

where: 
- \( N \): # of firms in a sector;
- The first term is the unweighted average of firm-level productivity
- The second term (OP cross term) reflects allocation of resources: do firms with higher productivity have greater market share.
- Requires representative cross sectional samples but does not require accurate longitudinal linkages
  - Cannot quantify directly importance of entry and exit
- By construction, cross term takes out country effects in productivity levels, so abstracts from some aspects of measurement error

Young Businesses and economic growth

- Theme that emerges:
  - Understanding U.S. growth dynamics at aggregate level, requires drilling down to dynamics of firms (e.g., the role of young businesses)
  - Emerging evidence for ROW is that these same factors are important AND that the dynamism of small and young businesses may be distorted by market structure and institutions

- One last twist:
  - Entrepreneurial dynamics starts at micro business level
  - ILBD: Nonemployers (e.g., sole props without employees) + Employers
Micro Businesses constitute a large share of businesses and a small share of revenue...

Source: Davis et. al. (2008)
Shares of New Employer Businesses in 1997 with Pre-History as Nonemployer Businesses

Source: Davis et al. (2008)
Taking stock…

- Creative destruction as evidenced by:
  - Job reallocation
  - Firm entry and exit

is a ubiquitous feature of market economies

- Churning is productivity enhancing

- Young, small businesses are very high growth, very volatile

  - Micro business to employer business transitions important
  - Financing important
Evidence/Questions for Emerging and Transition Economies

- Churning is high except for pre-transition economies
  - So churning by itself it not key
  - Is it distorted in some fashion?
    - Age, size, micro businesses?
      - Haltiwanger, Scarpetta and Schweiger (2008) find evidence that hiring and firing restrictions distort job reallocation/size relationship
      - Age and micro businesses should be high priorities for future data infrastructure

- Is it productivity enhancing?
  - Allocative efficiency differs substantially across countries

- Institutions and market structure?
  - Flexibility + Safety Net: What is the right mix?
Are Economic Crises Useful for Catalyzing Creative Destruction?

- Evidence from Indonesia: Hallward-Driemeier and Rijkers (2011)

- Do crises accelerate the process of creative destruction?

- Do crises obstruct the reallocative process?
  - Exacerbating market imperfections
  - Destroying potentially productive firms
Conclusions

- The crisis was excessively punishing in the short-run
  - Excess job losses
  - Attenuation of the link between productivity, survival and growth
  - within-firm adjustment dominated in explaining aggregate productivity growth:

- Changing credit market conditions amplified exit, but do not fully account for the observed attenuation.
  - Attenuation was strongest amongst firms that lack access to credit to start with

- Reallocation dynamics were not permanently scarred
  - The link between productivity and survival is restored post-crisis
  - Yet, the link between productivity and employment growth remains weaker than it had been pre-crisis
    - Perhaps because of more stringent labor market regulation?
Missing Pieces...many...

- Public sector/SOE retrenchment
  - Often managed poorly by public sector
  - Adverse selection: best workers leave and then need to be rehired

- Impact on workers:
  - Churning of jobs and firms implies need for worker mobility
  - How to achieve most of this with E-to-E flows and short duration unemployment?
  - Firm heterogeneity, dynamics and frictions have implications for earnings:
    - Earnings depend on who you are and where you work
In severe recessions there is substantial disruption in the labor market flows...

Safety Net Challenges?

- Flexibility of Jobs and Workers is critical in advanced AND emerging economies for productivity growth.
- Stifling job and worker reallocation through job and worker mobility restrictions dampens productivity levels and growth.
- **BUT** workers caught up in this turbulence even in U.S. can experience persistent periods of joblessness and earnings losses.
- Implement safety net without moral hazard and adverse selection problems, without dampening job and worker mobility but provides support...
