The Global Resort to Antidumping, Safeguards, and other Trade Remedies Amidst the Economic Crisis

Chad P. Bown

EXECUTIVE SUMMARY

WTO member countries turn to import-restricting “trade remedy” instruments during both good and bad macroeconomic times. Nevertheless, the historical economic evidence finds a strong link between economic downturns associated with recessions and exchange rate shocks and an *increase* in use of policies such as antidumping and safeguards. The sudden onset and global nature of the current economic crisis has created concern that countries may dramatically increase their use of such trade remedy instruments beyond the “normal” underlying current of protectionism associated with the ongoing process of adjustment associated with the forces of globalization.

Newly available data tracking the global use of these trade remedy instruments does indicate a marked increase in WTO members’ combined resort to these instruments beginning in 2008 that continued into the first quarter 2009 during the spread of the global economic crisis. The product-level use of trade remedies was 34.0 percent higher in 2008 relative to 2007, and the first quarter 2009 use was 22.3 per cent higher than the same period in 2008. The imposition of new definitive measures in 2009 is projected to be 18.5 per cent higher than the amount imposed in 2008.

A number of countries have resorted to these instruments, including almost all of the Group of Twenty (G-20) that are members of the WTO. These countries have few alternatives for invoking new forms of potentially WTO-consistent import protection as many are constrained both by the rules of the international system and because their pre-crisis applied tariff rates may have been somewhat close to their tariff bindings legally submitted to the WTO. The use of these import-restricting instruments is increasingly affecting “South-South” trade, i.e., developing country importers initiating and imposing new protectionist measures primarily affecting developing country exporters. The majority of the product-level actions to limit import competition intensively target exports from China.

Despite the increasing use of these instruments the amount of imports targeted by these measures thus far is relatively small. Collectively, the value of imports in 2007 for these major G-20 economies that has subsequently come under attack by the use of import-restricting trade remedies during the period of 2008 to early 2009 is likely less than \$29 billion, or less than 0.45 per cent of these economies’ total imports. With the exception of the concern raised by India’s use (1.8 percent of its total 2007 imports) in particular, country-by-country estimates indicate that the new protectionism thus far covers only 0.2 to 0.8 per cent of these economies’ total pre-crisis (2007) level of imports.

While the level of trade affected thus far may be small for most of these economies, a first assessment of some of the case-level data identifies many possible ways in which the crisis use of these import-restricting trade remedies may have economically important welfare-distorting effects. These potential losses go beyond the first order concern of the size of lost imports associated with targeted products and the losses to domestic consumers and using industries that suffer due to reduced access to imported varieties and higher prices. An established body of economic research identifies a number of unintended and adverse consequences associated with national resort to these trade remedies. We use this literature to guide our more detailed investigation of individual cases. We provide examples from crisis period cases in which firms may be using such remedies to generate anti-competitive effects imposing an additional burden on consumers. This may especially be the case in concentrated sectors such as chemicals and in steel in which recent M&A activity and legacy of foreign direct investment creates an environment in which multinational firms and their subsidiaries have access to trade remedies *in multiple jurisdictions* and the possibility of abusing them to segment markets.

The data on the crisis use of trade remedies also suggest that current protectionism, while limited, could quickly lead to escalating protectionism through at least three possible channels. The first of these is simple tit-for-tat retaliation. The second occurs after one country imposes a trade remedy on a product, and a second, third, fourth (etc.) country follow up by using their own import restrictions to target the same products due to the fear of a “trade deflection” surge of exports of the product into its own market. Finally, a newly imposed upstream trade barrier on imported inputs raises the cost to downstream users, creating competitiveness concerns that can generate additional downstream industry demands for cascading protectionism. The possibility that the major G-20 economies are currently invoking policies that may increase the probability of a spiraling, 1930s-style resort to Great Depression protectionism is therefore still a primary concern during the global crisis.

1 Introduction

WTO member countries turn to import-restricting “trade remedy” instruments during both good and bad macroeconomic times. Nevertheless, the historical economic evidence finds a strong link between economic downturns associated with recessions and exchange rate shocks and an *increase* in use of policies such as antidumping and safeguards. The sudden onset and global nature of the current economic crisis has created concern that countries may dramatically increase their use of such trade remedy instruments beyond the “normal” underlying current of protectionism associated with the ongoing process of adjustment associated with the forces of globalization.

Section 2 of this paper examines newly available data tracking the global use of these trade remedy instruments which does indicate a marked increase in WTO members’ combined resort to these instruments beginning in 2008 that continued into the first quarter 2009 during the spread of the global economic crisis. The product-level use of trade remedies was 34.0 percent higher in 2008 relative to 2007, and the first quarter 2009 use was 22.3 per cent higher than the same period in 2008. The imposition of new definitive measures in 2009 is projected to be 18.5 per cent higher than the amount imposed in 2008.

A number of countries have resorted to these instruments, including almost all of the Group of Twenty (G-20) that are members of the WTO. These countries have few alternatives for invoking new forms of potentially WTO-consistent import protection as many are constrained both by the rules of the international system and because their pre-crisis applied tariff rates may have been somewhat close to their tariff bindings legally submitted to the WTO. The use of these import-restricting instruments is increasingly affecting “South-South” trade, i.e., developing country importers initiating and imposing new protectionist measures primarily affecting developing country exporters. The majority of the product-level actions to limit import competition intensively target exports from China.

Despite the increasing use of these instruments the amount of imports targeted by these measures thus far is relatively small. Collectively, the value of imports in 2007 for these major G-20 economies that has subsequently come under attack by the use of import-restricting trade remedies during the period of 2008 to early 2009 is likely less than \$29 billion, or less than 0.45 per cent of these economies’ total imports. With the exception of the concern raised by India’s use (1.8 percent of its total 2007 imports) in particular, country-by-country estimates indicate that the new protectionism thus far covers only 0.2 to 0.8 per cent of these economies’ total pre-crisis (2007) level of imports.

While the level of trade affected thus far may be small for most of these economies, in section 3 we make a first assessment of some of the case-level data and identify many possible ways in which the crisis use of these import-restricting trade remedies may have economically important welfare-distorting effects. These potential losses go beyond the first order concern of the size of lost imports

associated with targeted products and the losses to domestic consumers and using industries that suffer due to reduced access to imported varieties and higher prices. An established body of economic research identifies a number of unintended and adverse consequences associated with national resort to these trade remedies. We use this literature to guide our more detailed investigation of individual cases. We provide examples from crisis period cases in which firms may be using such remedies to generate anti-competitive effects imposing an additional burden on consumers. This may especially be the case in concentrated sectors such as chemicals and in steel in which recent M&A activity and legacy of foreign direct investment creates an environment in which multinational firms and their subsidiaries have access to trade remedies *in multiple jurisdictions* and the possibility of abusing them to segment markets.

The data on the crisis use of trade remedies also suggest that current protectionism, while limited, could quickly lead to escalating protectionism through at least three possible channels. The first of these is simple tit-for-tat retaliation. The second occurs after one country imposes a trade remedy on a product, and a second, third, fourth (etc.) country follow up by using their own import restrictions to target the same products due to the fear of a “trade deflection” surge of exports of the product into its own market. Finally, a newly imposed upstream trade barrier on imported inputs raises the cost to downstream users, creating competitiveness concerns that can generate additional downstream industry demands for cascading protectionism. The possibility that the major G-20 economies are currently invoking policies that may increase the probability of a spiraling, 1930s-style resort to Great Depression protectionism is therefore still a primary concern during the global crisis.

2 Monitoring the Combined Use of Trade Remedies

Economic evidence from historical data (e.g., Knetter and Prusa, 2003; Irwin, 2005) finds a strong link between an *increase* in use of trade remedies during economic downturns associated with recessions and exchange rate shocks. The effort to track, assess, and examine the impact of the spread of protectionism during the current global economic crisis is complicated. First, the use of “traditional” trade remedy instruments of antidumping (AD) and global safeguards (SG) has spread to new countries.¹ Second, many countries are also adopting and implementing use of other “new” trade remedy instruments such as China-specific transitional safeguards (CSG) and countervailing duties (CVD) under “anti-subsidy” laws.² Of the four policy instruments that we include in our analysis, the

¹ For surveys see Blonigen and Prusa (2003) for antidumping, and Bown and Crowley (2005) for safeguards.

² India’s activity in 1Q 2009 provides an illustrative example: India initiated 3 AD investigations, 3 CSG investigations, 2 SG investigations, and its first ever CVD investigation, also one in which it targeted China.

CSG is the least well known because of its relatively recent arrival on the scene – it is an instrument to which WTO members negotiated access beginning in 2001 as part of China’s agreement to accede to the WTO, and it remains in place as a potential import-restricting policy instrument through 2014. The other lesser known and historically lesser-utilized instrument is the CVD policy. There may be some cause for speculation of a global shift toward increased use of this particular anti-subsidy instrument associated both with increased pressure relating to exports from China, as well as the current spread of the use of subsidies in government stimulus packages in light of the global economic crisis.³

Therefore, while we are interested in tracking the combined use of these relatively substitutable forms of import protection especially in light of the global economic crisis, doing so requires more than simply additively aggregating their use. Some of these trade remedy instruments apply to specific foreign countries while others are applied on a more nondiscriminatory, most-favored-nation (MFN) basis across foreign sources.⁴ In the presence of multiple trade remedy instruments which can be “substitutes” providing the same access to import protection, one way to normalize the data to assess the frequency of their *combined* use over time is to examine *non-redundant* requests for new protection undertaken within a policy-implementing economy at the *product* level.⁵ For example, such an approach does make a country’s use of AD or CVD targeting multiple foreign sources of the same imported product more comparable to global safeguard (SG) protection. This is the approach we adopt in sections 2.1 through 2.5, before then examining in section 2.6 the collective size of the imports likely to be affected by the use of these trade remedy instruments.

³ The first reason is the increasingly prominent role of China’s exports in the world trading system and the fact that, unrelated to the financial crisis, the U.S. changed a 23 year old policy in March 2007 when the Department of Commerce indicated it would now “consider” industry petitions for import protection under the nation’s countervailing duty initiations against China. As one of the pivotal players in the rules-based WTO system, the signal that the U.S. sent by initiating CVD use against China may spur other WTO member countries to adopt a similar approach. The second reason is due to the massive subsidies that major economies are currently imposing as part of their stimulus packages to deal with the global economic crisis. Some trading partners may seek to use CVDs to address what they perceive as trade-distorting effects of such subsidies.

⁴ In principle these trade remedy instruments do require different forms of evidence before they can be applied. AD requires evidence of less-than fair value pricing (dumping) and injury to the domestic industry from the dumped imports; CVD requires evidence of foreign subsidization and injury, SG requires evidence of injury caused by increasing imports, and CSG requires evidence of injury caused by increasing imports from China. Nevertheless, economic research such as Bown (2004) and Bown and McCulloch (2003) has shown that these instruments can be applied in ways that have similar effects on trade flows.

⁵ For example, by an initiation or measure being defined at the *product level*, we mean that the U.S.’s two 2Q 2008 antidumping investigation of “Certain circular welded carbon quality steel line pipe” from Korea and from China are treated as one product-level investigation. Furthermore, to ensure product-level initiations are not *redundant* across policy instruments, a WTO member’s simultaneous AD and CVD cases over the same product are treated as one case. For example, the U.S.’s 2Q 2008 simultaneous AD and CVD investigations of “Certain circular welded carbon quality steel line pipe” from China are also treated as one product-level investigation.

In the next section we begin our discussion of the combined use of these trade remedies. For readers interested in tracking the trends in the underlying data on a policy-by-policy basis, appendix figures A through D present information on the initiations and measures imposed of each of the four distinctive trade remedy instruments over time.

2.1 The increase in trade remedy use during the crisis

As figure 1a indicates, WTO members initiated 35 new product-level investigations requesting imposition of new import restrictions under national trade remedy laws during the first quarter (1Q) of 2009, our most recently available data.⁶ This is an increase of 22.3 per cent compared to the same period in 2008 and also continues an upward trend. The total number of new, product-level import-restricting investigations launched in 2008 was 34.0 per cent higher than the number of new investigations initiated during 2007. It is worth pointing out, however, that the 2007 year was a relative low point for new trade remedy initiations under instruments such as AD, SG, and CSG (see again appendix figures A through D).

[Figure 1 here]

The historical data on the use of these trade policies, especially in the case of the dominant AD instrument in use in many countries around the world, indicates that the vast majority of new investigations and requests for import protection ultimately result in the imposition of new “definitive” import restrictions in the form of tariffs, price undertakings, or quantitative restrictions. While the share of new investigations resulting in the imposition of final measures in developed economies like the U.S. and EC may have recently fallen to the range of 50-60 per cent, the share is much higher in many developing countries. This includes some of the countries that are the major new sources of the current rise in initiated investigations (e.g., India, Turkey), where it is not uncommon to find 80-95 per cent of the initiations resulting in the imposition of new measures. Overall, 79 per cent of the investigations initiated in 2007 that reached the stage a final determination by 1Q 2009 resulted in the imposition of a definitive import restriction.

⁶ Most of this activity is antidumping, however, the use of other instruments has been increasing recently. As described in the *Global Antidumping Database*, these figures are based on original source, nationally provided data for AD and CVD. The data reported in the text and figures is based on that collected for 20 AD- (18 CVD-) using countries, and while this does not comprehensively cover the global use of the instrument, historically these countries represented 90 per cent of AD (93 per cent of CVD) initiations by all WTO members during 1995-2007. The data collected on countries’ use of SG and CSG is comprehensive and obtained from the WTO in addition to national government sources.

Figure 1b tracks the imposition of new measures at the product level across the same sample of WTO members illustrated in figure 1a. WTO members imposed 20 new *product-level* definitive import restrictions in 1Q 2009 under national trade remedy laws, an increase of 5.1 per cent compared to 1Q 2008, and the annualized rate translates to the frequency of new import restrictions in 2009 to be 11.9 per cent higher than the rate at which definitive new measures were imposed in 2008.

However, this annualized figure will certainly under-predict the *actual* increase in imposed measures in 2Q through 4Q of 2009. The increase in the rate of imposed measures is expected to be *larger* than 11.9 per cent higher than the number imposed in 2008, given the sharp increase in newly initiated investigations in 2Q through 4Q of 2008 (see again figure 1a). To highlight this point, in figure 1b we illustrate the *projected* imposition of definitive new import restrictions at the product-level for these countries between 2Q 2009 and 1Q 2010. These projections are computed from assumptions and parameters estimates from the 2007 data: 79 per cent of new initiations result in definitive measures, it takes four quarters to reach imposition of a measure after initiation of an investigation, and the number of new investigations initiated each quarter between 2Q 2008 and 1Q 2009 are as in figure 1a. While this approach is admittedly crude and does not control for the likelihood that the share of investigations that may result in definitive measures may rise during the crisis, as a conservative benchmark it suggests at least an 18.5 per cent increase in imposed measures in 2009 when compared to 2008.

2.2 The countries that are using the trade remedies to limit imports

In addition to documenting the time trend of trade remedy use, figures 1a and 1b also illustrate the relative frequency with which these actions are being taken by developed versus developing economy users of import protectionist instruments. The figures indicate that increasingly these actions are being undertaken by developing countries.

Table 1 provides further information on the country-level use of these trade policy instruments between 1Q 2007 and 1Q 2009. Most striking is that since the onset of the crisis – or roughly between 1Q 2008 and 1Q 2009, developing countries initiated 74 per cent of all new investigations. This use has been dominated by India (20 per cent), Argentina (12 per cent), Turkey (8 per cent), Brazil (7 per cent), and China (5 per cent). Developed economies initiated only 26 per cent of the new investigations during this time, although most of those derive from initiations by the United States (8 per cent) and the European Union (7 per cent).

[Table 1 here]

2.3 The targeted sectors

Table 2 illustrates the product-level requests by sector for new import restrictions under these trade remedy instruments between 1Q 2007 and 1Q 2009. For the developed economy users, the industries most frequently resorting to these instruments are chemicals, iron and steel, and machinery, with 65 per cent of the developed economy initiations since 1Q 2008 occurring in just one of these three sectors. As these are the historically dominant sectoral users of trade remedies, the predominance of their use during the crisis is not surprising. Nevertheless, the recurrence of use in these sectors, and the possibility of abuse on anti-competitive grounds is a potential cause for concern and additional inquiry and is an issue to which we will return in more detail in section 3 below.

[Table 2 here]

Developing country firms have also initiated a number of new requests for import protection under trade remedy instruments since 1Q 2008 in the steel, chemicals, and machinery sectors (44 per cent of total developing country initiations). The other two sectors with a high number of new investigations in developing countries are textiles and apparel and plastics and rubber, which combine for another 27 per cent of the total developing economy activity under these instruments during the crisis.

2.4 The targeted exporters

Table 3 illustrates the frequency with which exporters in various countries have been *targeted* by country-specific trade remedy instruments such as AD, CVD and CSG. Given the economies that are using these trade policies and the sectors that are being targeted for new import restrictions, it is not surprising that the exporters targeted by these actions are primarily located in other developing countries. The frequency with which developing countries as a whole have been targeted in country-specific trade remedy investigations is 72 per cent during the crisis period of 2008 through 1Q 2009, which is a slight increase from 68 per cent in 2007.

[Table 3 here]

2.5 China as the export target

The use of country-specific trade remedy instruments such as AD, CVD and CSG documented in table 3 also illustrates the intensity with which these using countries are targeting exports from China. Of the country-specific trade remedy initiations and measures imposed, China alone constituted roughly 40 per cent of the total of countries named in the investigations during this period and slightly more than 40 per cent of the definitive measures that have been imposed.

A different method of measuring the intensity of use of these trade remedies against China's exports is to examine this from the *product*-level perspective. For example, in 1Q 2009, the other WTO members (from whom this data is derived) named China in 19 of the 27 (70 per cent of) newly initiated product-level investigations under (AD, CVD, CSG) laws that require the investigating country to specifically name at least one exporting country.⁷ In 12 out of these 27 (44 per cent of) investigations, China was the *only* country named. Finally, in the remaining 7 instances in which China was named as one of multiple exporting countries, there was *only one* other exporting country named in the product-level investigation. The evidence suggests that a focus of many of these trade policy initiations are to restrict imports from China.

The WTO membership's use of trade remedy instruments to target China's exports is not new – it continues a trend dating back to China's WTO accession in 2001 and even earlier (Bown, forthcoming a). Explanations for the increasing intensity of use of these instruments against China's exports since 2001 include: China's export increase during this period, as more exports means more potential foreign targets for use of antidumping and other trade remedies; China's receipt of MFN treatment in WTO members' tariff schedules since 2001, which constrains to trade remedy instruments WTO members' ability to impose potentially WTO-consistent (but discriminatory) import protection against China; China continues to be treated as a “non-market economy” (NME) in many countries' antidumping procedures which gives AD authorities more discretion than is available vis-à-vis other exporters to calculate dumping margins; and many WTO members do not feel as though China's state-owned enterprises (SOEs) and its government's use of other explicit and implicit subsidies have been sufficiently curtailed since its 2001 accession.

One important question is whether the global crisis *increases* the intensity of use of these instruments against China's exporters relative to exporters in other WTO member countries. Will the phenomenon of using trade remedies to target China create additional political pressure within China either to increase its own use of trade remedies (perhaps as a response partially-motivated by retaliation), or to take a more active role in the WTO to attempt to slow down the use of these instruments (perhaps through formal dispute settlement, where it has been thus far slow to engage).⁸

Finally, figure 2 illustrates the relative frequency with which trade remedy-using countries are targeting China's various export sectors with newly initiated investigations. There are a number of Chinese exporting industries facing newly initiated investigations during this period – including chemicals, iron and steel, machinery, and textiles. We return to a more detailed discussion of the same

⁷ Of the 35 product-level newly initiated investigations in the 1Q 2009, six did not name any exporting countries because they were global safeguards, and China initiated two investigations itself.

⁸ For a discussion of recent dispute activity at the WTO between the U.S. and China, see Bown (2009b).

Chinese export products being targeted in different foreign markets in our more detailed discussion of some of the underlying cases in section 3 below.

[Figure 2 here]

2.6 The size of the imports under attack from the use of such trade remedies

Here we provide a first attempt to assess the size of the potential economic problem these potential trade remedies pose. I.e., how much trade is coming under attack from the increasing resort to trade remedies?

Table 4 provides a first pass at this question by documenting a number of pieces of data on the size and relative importance of the 2007 (i.e., pre-crisis) level of trade at the level of 6-digit Harmonized System (HS) imports associated with the products and exporting countries that are the targets of most of the G-20's newly initiated investigations since the beginning of 2008 and continuing through 1Q 2009.⁹ The table reports four columns of data: the 2007 value of imports subsequently being targeted (i.e., "targeted imports") by each economy's new and subsequent investigations since 1Q 2008; the targeted imports as a share of the country's total 2007 imports; the targeted imports deriving from China as a share of the total targeted imports, and the targeted imports deriving from China as a share of the country's total imports from China. We construct this table for 12 of the largest WTO economies and users of these trade remedy instruments – four developed and eight developing countries.

[Table 4 here]

Not surprisingly, table 4 first reveals that the two economies with the largest *levels* of imports potentially affected by the remedies are the EC (\$8.0 billion) and the U.S. (\$7.5 billion). However, the *relative* importance of the targeted imports is fairly small, as only 0.4 per cent of 2007 imports in these economies are in 6-digit HS product categories that have become subject to new investigations initiated since 1Q 2008. Table 4 also indicates that developed countries such as Canada and Australia not only have a much smaller level of trade potentially affected, but the targeted imports measured as a share of their total imports is much smaller than the U.S. and EC as well.

The data for some of the developing economy users of these trade remedies is a bit more worrisome. India, the most frequent user of these trade remedies (table 1), is estimated to have \$3.9

⁹ The 2007 imports are the last year for which the data is systematically available across all of these countries.

billion in 2007 imports that have been subject to new trade remedy investigations during the crisis thus far – 1.8 per cent of its total 2007 imports. China (0.64 per cent), Argentina (0.7 per cent) and Turkey (0.8 per cent) are other examples of countries whose share of their total 2007 imports being subject to new import restrictions during the crisis is greater share than that of the U.S. and EC. China is an interesting case because while its underlying frequency of cases has been limited during the crisis (only 8 new product-level initiations since 1Q 2008), the investigations collectively covered a relatively sizable level of 2007 imports (\$6.2 billion).

Before moving to relative comparisons of the data, it is worth noting that there are at least three reasons to speculate that the table 4 estimates on the size of value of imports affected by crisis use of trade remedies thus far are likely to provide an *upper bound* on the total size of imports affected by these trade remedy initiations: 1) the trade data is matched to the trade remedy data at the 6-digit HS level, and in practice many countries impose trade remedies at the 8- or 10- digit HS level, thus not affecting all sub-products within a given 6-digit category; 2) not all of these newly initiated investigations will result in imposed measures;¹⁰ and 3) imports in 2008 and 2009 may fall from their pre-crisis (2007) levels for reasons unrelated to trade remedies but instead because of other (demand side income effects or supply side credit constraints) shocks associated with the crisis.¹¹

Next, table 4 also reveals how the potential economic impact of the trade remedy use during the crisis period may affect China's exports differentially depending on the using country. Of the combined imports targeted by these eleven other economies use of trade remedies since the crisis, 58.9 per cent of those targeted imports derived from China's exporters alone. On a country-by-country basis, this ranged from more than 90 per cent of the imports subject to investigations in the U.S. and Canada, to only 31 per cent in Mexico and less than 15 per cent of the imports targeted by Turkey's use of new trade remedies.

According to the top row of data in table 4, 1.6 per cent of China's total 2007 exports to these eleven other economies were in 6-digit HS products that would become subject to their newly initiated trade remedy investigations sometime after the beginning of 2008. Not surprisingly, there is substantial variation in this statistic across the eleven economies. The highest is India, which has subsequently initiated investigations under one of its trade remedy laws (during 2008 through 1Q 2009) covering more than 7.6 per cent of its 2007 imports from China. Other countries that have investigated a

¹⁰ Nevertheless, research such as Staiger and Wolak (1994) has shown that the mere harassment of initiations can have an adverse effect on trade flows, even in cases in which definitive trade restrictions are not imposed.

¹¹ Furthermore, the likelihood of trade diversion (Prusa 1997, 2001; Konings, Vandenbussche and Springael 2001; Bown 2004) with the discriminatory application of these trade remedies indicates that even some of the imports destroyed by the imposition of new trade barriers (from the named sources, what we have used to construct table 4) will result in increased imports of the same product from non-named foreign sources.

relatively large share of their total 2007 imports from China during this same subsequent economic crisis period include Argentina (3.2 per cent), Brazil (2.5 per cent), Canada (2.2 per cent) and the U.S. (2.0 per cent).

Finally, while these are not broken out in table 4 specifically, it is worth noting that some of major economies do have two or three large trade value cases that may be the ones that largely determine just how much trade will be affected by the use of trade remedies during the crisis. Particular examples for the U.S. include the China safeguard (CSG) case initiated in April 2009 over “Tires,” which has the potential to impact \$1.9 billion of imports from China (2007 values). The EC has more than half of its \$8 billion in imports under investigation being tied up in only three different product-level investigations. The EC has \$2.7 billion in imports from the U.S. associated with two cases initiated in 2008 – the “Biodiesel” case for \$1.7 billion and “Prepared binders for foundry molds or cores” for \$970 million. (Coincidentally, with respect to this last case, the U.S. has a simultaneous investigation over the same 6-digit HS product imported from China.) The third major EC case is its investigation involving “Flat-rolled products of stainless steel” from China, Korea and Taiwan, as it had 6-digit HS imports totaling \$1.8 billion in 2007. Finally for China’s use of trade remedies, more than half (\$3.7 billion) of the \$6.2 billion in potentially affected imports stems from a 2009 case covering 6-digit HS imports from Korea and Thailand of “Terephthalic acid.”¹²

3 Questions raised by the early data on use during the crisis

Even if the overall level of imports affected by the increasing use of these trade remedies during the crisis is not currently large, economists have a long established line of research identifying many channels through which the use of these policy instruments can generate unintended consequences with costly implications for economic welfare. In this section we use this economic research to guide our investigation of underlying cases that constitute potentially worrisome examples of resort to trade remedies during the crisis.

3.1 Crisis protectionism leading to escalating protectionism?: Tit-for-tar retaliation, trade deflection, and cascading protectionism

In this section we explore three channels through which current resort to trade remedy protectionism during the global crisis creates incentives for follow-on use by others of trade remedies and the

¹² Again, the estimate of the size of trade at stake in these cases may be over-estimated given that our data derives from the 6-digit HS import data and not the subproducts at the 8- or 10-digit HS level that may be applied in these particular investigations.

possibly worrisome escalation of protectionism. To begin this exercise, we examine the use of trade remedies across countries over “common products” listed in table 5. The table presents 35 instances in which *more than one* policy imposing country initiated a trade remedy investigation over the same 6-digit HS product(s) during the period covered by 1Q 2007 through 1Q2009. These 35 product examples cover more than 70 unique 6-digit HS codes. The table presents the name of the product, the 6-digit HS product(s) common to the investigating countries, the names of the countries undertaking the common investigations, as well as the name of targeted exporters associated with each investigation. The product list is organized numerically by the underlying HS codes.

[Table 5 here]

The first channel is that firms may use a policy like antidumping to discipline foreign rivals in direct tit-for-tar retaliatory actions. While it is relatively rare for two economies to target one another with simultaneous investigations over essentially varieties of the same product, one possible example of direct AD retaliation within varieties of the same product involves the recent U.S.-EC interaction over sodium products (case 1 on table 5). In October 2007, the U.S. firm E.I. DuPont de Nemours & Co. was a domestic petitioner requesting initiation of a U.S. AD investigation over “Sodium metal” from France, accusing the French firm Métaux Spéciaux (MSSA SAS) of dumping into the U.S. market. In May 2008, the U.S. imposed a preliminary AD duty of 62.62 per cent. In July 2008, the EC initiated AD and CVD investigations over “Sodium metal” from the U.S. in the same 6-digit HS product category. In December 2008, in the U.S. investigation, the USITC ruled negative on injury determination, and thus no final measures were imposed. As the spring of 2009, the EC investigation was still ongoing.

Of course it is also not necessary for retaliation (i.e., the current trade remedy provoking use of future protectionism) to be limited to only instances in which countries import and export the same product. One country’s excessive reliance on the use of trade remedies can lead to its exporters becoming foreign targets in other products in the same industry, or in other industries altogether, thus expanding the potential escalation of protectionism.¹³ This is of particular concern given the current economic crisis and the desire to avoid repeating the spiral of protectionism associated with the 1930s and the Great Depression era.

A second concern raised by the “Sodium metal” cases is that even if no antidumping measures are imposed, the two firms that would otherwise compete vigorously with each other in the U.S. and

¹³ Studies of the retaliatory links and incentives created under antidumping include Blonigen and Bown (2003), Prusa and Skeath (2004), and Feinberg and Reynolds (2006).

EC markets (resulting in lower prices for consumers) may be able to use the AD process to reach an implicitly collusive agreement to less vigorously compete in each other's market (thus hurting consumers). We further explore possible anti-competitiveness effects to the use and abuse of trade remedies in section 3.2 below.

A second channel through which current protectionism may create incentives for future, additional protectionism is associated with the phenomenon of “trade deflection” (Bown and Crowley 2006, 2007; Durling and Prusa, 2006) in which follow-on countries may resort to use of these trade policy instruments to prevent export surges of the same product to the first country's trade remedy imposition. As one potential example, consider the “Footwear” cases associated with product number 18 on table 5. Brazil began the potential cascade of protectionism in footwear by initiating an antidumping investigation against China in December 2008. Fearing that the trade shut out of the Brazilian market may then “deflect” from that market and surge into its own market, other importing countries may be prompted to implement their own trade remedies on imports of the product, perhaps against the same exporter. In the case of footwear, Argentina followed Brazil's AD case against China by initiating an AD case of its own against China in March 2009 (Canada had also initiated a footwear AD against China in February 2009). The existence of so many examples of product overlap in table 5, as well as the frequency with which common exporters are being targeted across countries, suggests this may be a part of the explanation for these and future acts of protectionism in the data.¹⁴

A third channel of current use of trade remedies creating additional incentives for future use is sometimes referred to as “cascading protectionism” (Hoekman and Leidy, 1992). Another concern raised by the table 5 list of products is the number of measures likely to affect intermediate *inputs*. Imposing new trade barriers on inputs can adversely affect downstream producers by increasing their costs, thus decreasing their competitiveness in the global marketplace with other foreign suppliers that do not face such additional costs.¹⁵ One important example from table 5 is found in products 12 through 16, which are various forms of yarns and fibres that are crucial inputs into the production of textiles and apparel, an important source of industrial output and exports for many developing countries. Interestingly, the countries that are *imposing* these new restrictions on yarn and fibres are Turkey, Peru, Argentina, South Africa, Brazil, and India. These developing economies are many of the same countries whose textile and apparel industries are already struggling to compete in global markets with

¹⁴ There are other possible explanations for this aside from trade deflection which merit investigation as well, such as that Brazil identifying Chinese footwear producers of dumping informed domestic firms in Argentina (and Canada) and triggered their initiatives to pursue cases as well.

¹⁵ For a theory and an empirical application to the steel industry of how trade remedies can be used strategically to raise a rival firms' costs, see Durling and Prusa (2003).

China's textile and apparel exports. Using trade remedies to raise the cost of an integral input is likely to have unintended and yet important downstream competitiveness consequences, including increasing the probability that these developing economies' textile and apparel producers may themselves be the next in line demanding their own protectionism through trade remedies.

3.2 Antidumping, multinational firms, and potential concerns of anti-competitive behavior

There are a number of additional worries when it comes to the use of policies such as antidumping. Firms may abuse the policy by convincing government policymakers to impose trade barriers that, while in the firms' interest, are not in the overall interest of the country. There are a number of mechanisms through which firms may manipulate such policies – including by using it as a tool to get government policymakers to assist (perhaps unwittingly) firms to segment markets (raising anti-competitiveness concerns), and as a tool to raise domestic rivals costs. The potential for abuse is increasingly heightened when the key industrial users of the policies are multinational firms with headquarters and subsidiaries situated globally that have the ability to tap into (and to be affected by) trade remedies in many different political jurisdictions.¹⁶

First, the desire to segment markets identified in the U.S.-EC “Sodium metal” cases described in section 3.1 is not limited to rival firms, but it may also take place between subsidiaries of the same firm. A careful examination of the repetitiveness of firm names in trade remedy initiations (compiled into the publicly available *Global Antidumping Database*) allows us to identify two potential examples worthy of further investigation.

One example is an instance in November 2008 in which the U.S. imposed definitive AD duties on “Polyethylene Terephthalate (PET) film, sheet, and strip” from China, including 3.49 per cent on DuPont Teijin Films China Ltd. According to its website, DuPont Teijin Films is a 50-50 global joint venture between the American firm DuPont and the Japanese firm Teijin.¹⁷ According to the public records in the case, the American subsidiary DuPont Teijin Films is one of the domestic petitioners behind the U.S. effort to target the Chinese subsidiary of the same firm with new import restrictions that could have the effect of segmenting markets.

A second example took place when India imposed a definitive AD measure on “Compact fluorescent lamps” from China in February 2009. The measure was an agreement that Chinese firms, would voluntarily agree to raise prices and for a given downward-sloping import demand curve, by extension, reduce export volumes. One of the Chinese firms agreeing to the new price undertaking was

¹⁶ Important contributions to the economic research literature on the ways in which access to antidumping can inadvertently increase the concern for anti-competitive behavior include Prusa (1992), Messerlin (1992), and Veugelers and Vandenbussche (1999).

¹⁷ See <http://www.duponttejinfilms.com>.

Osram China Lighting Co. Ltd., a subsidiary of Osram, which is a German-headquartered firm. This is particularly interesting given that one of the domestic petitioning firms was Osram India Pvt. Ltd., the Indian subsidiary of the same German-headquartered parent Osram.¹⁸ Thus this is an example of one subsidiary targeting another subsidiary with a new trade restriction that could also have the anti-competitive effect of segmenting markets.

As a second channel through which multinational firms and foreign direct investment may have distorting effects on the use of trade remedies, consider a situation in which the imposition of import protection in the past created incentives for firms to expand the reach of their multinational operations and “tariff jump” to avoid trade barriers by creating local producers that would not be subject to future import restrictions.¹⁹ Once a multinational firm has the local presence, it may become part of the domestic industry petitioning to use trade remedy instruments to increase the likelihood of import restrictions against other foreign sources (that have not established a local presence), thus affecting the discriminatory application of the trade remedy use. Blonigen and Ohno (1998), for example, provide a model in which foreign firms that locate production in the home country then use increased exports to increase protectionist pressures within the home country to trigger new and larger barriers against other foreign competitors in future periods.

The recent wave of mergers and acquisitions (M&A) in the global steel industry in particular create a number of potential instances in which this sort of behavior by firms is now possible. Consider the activities of Indian steel firms such as Mittal, which acquired the European steel producer Arcelor (to become ArcelorMittal) in 2006, and Tata, which merged with the UK steel firm Corus in 2007, and how this may affect the current application of trade remedy use in both the EC and in India during the global economic crisis.

In the case of the EC, consider three examples of recent AD petitions for new trade remedies over steel products that have involved ArcelorMittal and/or Corus/Tata being part of the domestic EC industry petitioners bringing forward a case. In December 2008, the EC imposed definitive AD duties on “Certain welded tubes and pipes of iron or non-alloy steel” from Belarus, China and Russia. In February 2009, the EC imposed preliminary AD duties on “Wire rod” from China, Moldova, and Turkey. In April 2009, the EC imposed preliminary AD duties on “Certain seamless pipes and tubes” from China. In *none* of these cases did the trade remedies target imports from India, despite Indian exporters being a major competitive producer of steel globally.

With respect to India’s own use of new import restrictions over steel during the crisis, the global M&A activity by Indian steel firms also has the potential to shape which foreign targets are

¹⁸ See http://www.osram.com/osram.com/About_Us/The_Company/index.html.

affected by its potentially discriminatory application of antidumping. As a potential example, in March 2009 India imposed preliminary AD duties on “Cold-rolled flat products of stainless steel” from the EC and 7 other exporting countries. The Indian domestic petitioner behind this particular case was Jindal Stainless Limited, and not domestic firms like Tata or Ispat from the Mittal Group.²⁰ On the other hand, when the Indian domestic petitioners including Ispat (Mittal Group) filed a December 2008 AD investigation over “Hot rolled steel products” from 15 exporting countries, the only EC member state named in the investigation was the most recently added member, Romania.

While these examples are surely not conclusive evidence of anti-competitive behavior, given the scope for abuse of antidumping and other trade remedy provisions, these and other AD investigations should be closely monitored. One serious concern is that firms will use the cover of the global economic crisis to stoke protectionist sentiment and these trade remedies will inadvertently be applied by government policymakers in a way that *reduces* competitiveness conditions. This has the potential for far-reaching and longer-lasting effects than the costs imposed on consumers and consuming industries associate with the “mere” imposition of trade restrictions.

4 Policy Implications and Conclusions

The global economic crisis has been accompanied by an increase in the global use of import-restricting trade remedies as a protectionist response. While the data suggests that there has been an increase, the scale of the use of these particular policy instruments has been limited. The most intensive use has been in developing countries, and the biggest and most worrisome user being India. The export targets of the new protectionism are increasingly concentrated in other developing countries, and the intensity of use against China’s exporters is also of concern for the longevity and sustainability of the trading system.

While the scale of the problem associated with the use of trade remedies during the crisis thus far is not massive, there are a number of worrisome trends in how it is being used to suggest that future use may also increase, due to retaliation, the response to trade deflection concerns, and cascading protectionism to downstream industries. The use of antidumping during the crisis in sectors with substantial recent M&A activity also stokes concerns of potential abuse and anti-competitiveness concerns that firms may be using these policies in their attempts to segment markets.

The first lesson for policymakers stemming from this data and from decades of economic research into the effects of these policies is to hold the line. To the greatest extent possible,

¹⁹ Even antidumping itself may create incentives for firms to engage in FDI in order to avoid future application of such trade restrictions. For evidence, see Belderbos (1997) and Blonigen (2001).

²⁰ However, Jindal Stainless Limited does report on its website subsidiaries in the UK (Jindal Stainless UK Limited, London) and Italy (Jindal Stainless Italy S.r.l.), see <http://www.jindalstainless.com/subsidiary-companies.html> , last accessed on 10 June.

policymakers should refuse new requests to implement such acts of import protection through trade remedies.

However, if it is not possible to dismiss all the requests for protection, economists have a duty to advise policymakers on how to impose any new trade barriers in a means that are least distortive and costly (in terms of economic efficiency) lasting for as short a period as possible. If policymakers must resort to use of trade remedies amidst political pressure during the economic crisis, there a number of reasons to strongly encourage the protectionism be fitted into using the global safeguards (SG) instrument and *not* the other country-specific instruments like AD, CVD or the CSG.

First, the WTO rules require SG protection must be applied on a nondiscriminatory (MFN) basis, which is more likely to prevent potentially costly trade diversion than trade remedies imposed in the form of AD, CVD or CSG. The imposition of an import restriction on, say, China alone may impose other efficiency costs if it just creates incentives for domestic consumers to switch their sourcing to other higher cost foreign suppliers that are not subject to the trade restriction. While a SG does still raise the price facing consumers and thus impose a cost on the economy, an efficiency “benefit” to the policy is that it does not sever the link between any remaining imports and the identity of the most efficient *foreign* source of those imports.

Second, the WTO’s SG provisions have a built-in time process for scaling back and ultimately eliminating the protection over time. This is important during the global crisis as the speed with which countries are able to extricate themselves from their economic downturns is likely affected by their impediments to growth, which would include the imposition of new trade barriers taken on during the crisis. Historically, SG-imposing countries have been much more likely to remove the protectionism than has been the case for AD or CVD. And as table 6 indicates, it is unlike that adversely affected exporters will be able to resort to the WTO’s dispute settlement provisions anytime soon to deal with the problem of getting potentially WTO-inconsistent AD or CVD measures removed. The table shows that the developing country exporters that are the main target of the current use of these trade remedies during the crisis have challenged less than 5 per cent (38 out of 909) of the imposed measures through formal WTO dispute settlement. Thus it is better that such policies not be imposed in the first place, but that a global safeguard with a built-in phase-out mechanism, be used instead.

[Table 6 here]

The third and fourth reasons to prefer SG are more subtle but nevertheless still important. Because global safeguards are “fair trade” provisions, they are less adversarial to foreigners. Unlike AD or CVD, using SG does not require an allegation of foreign wrongdoing (dumping or illegal

subsidies). Instead, SG entails greater recognition and acceptance that the act of protectionism is a response to a crisis. Using SG over AD/CVD may thus decrease the likelihood of foreign retaliation and the ramping-up of protectionist sentiment in trading partners. As a final technical matter, SG is simply less costly for a bureaucracy to administer than policies such as AD and CVD, which are much more data intensive. Taking as given that the end of an investigation is simply going to result in protectionism, it seems wasteful for developing countries in particular to use scarce governmental resources administering the more complex form of what are similarly protectionist policies.

Table 4. The Size of Imports under Attack by the use of Trade Remedy Initiations during 1Q 2008 - 1Q 2009

Importing Country	Value of 2007 imports for products facing new investigation during 2008-1Q2009	Investigated products as a share of country's 2007 total imports	Investigated imports from China as a share of all investigated imports	Investigated imports from China as a share of all imports from China
Total	\$28,977,070,131	0.0045	0.5889	0.0164
Developed Economies				
EC	\$8,032,246,785	0.0041	0.3983	0.0101
U.S.	\$7,458,154,471	0.0037	0.9032	0.0198
Canada	\$852,235,098	0.0022	0.9160	0.0218
Australia	\$95,253,092	0.0006	0.7643	0.0030
Developing Economies				
China	\$6,183,277,841	0.0064	na	na
India	\$3,943,953,974	0.0180	0.4749	0.0762
Turkey	\$1,383,230,509	0.0081	0.1452	0.0152
Brazil	\$540,548,035	0.0044	0.5787	0.0248
Argentina	\$315,794,401	0.0070	0.5221	0.0324
Pakistan	\$108,991,018	0.0033	0.5405	0.0141
Mexico	\$55,581,511	0.0002	0.3106	0.0006
South Africa	\$7,803,396	0.0001	0.7216	0.0007

Sources: Product level (6-digit HS codes) for AD, CVD, CSG and SG investigations for these countries obtained from the *Global Antidumping Database* and matched to 6-digit HS Comtrade 2007 import data available via WITS. Intra-EC trade is excluded.

Table 5. Examples of Product Overlap of Trade Remedy Investigations Across Countries, 1Q 2007 - 1Q 2009

Product	Common HS Code (6-digit)	First Initiating Country	Subsequent Initiating Countries	Targeted exporters (initiated case in which named)
1 Sodium	280511	1. U.S.	2. EC	EC (1); U.S. (2)
2 Nitrites	283410	1. U.S.	2. India (CVD)	China (1,2); EC (1)
3 Citric acid	291814	1. South Africa	2. EC 3. U.S.	China (1,2,3); Canada (3)
Citric acid	291815	1. EC	2. U.S.	China (1,2); Canada (2)
4 Matches	360500	1. U.S.	2. Ukraine (SG)	India (1)
5 Prepared binders for foundry molds or cores	382490	1. U.S.	2. EC	China (1); U.S. (2)
6 Polyethylene terephthalate (PET) film	392062	1. Brazil	2. U.S. 3. Turkey (CVD)	India (1,3); Thailand (1,2); Brazil (2); China (2); UAE (2)
7 Polyesters	392069	1. Brazil	2. Turkey (CVD)	India (1,2); Thailand (1)
8 Motor car tires	401110	1. Brazil	2. U.S. (CSG)	China (1,2)
9 Bus and truck tires	401120	1. U.S.	2. Brazil 3. India	China (1,2,3); Thailand (3)
10 Laminated flooring	441113, 441114, 441192, 441193	1. Turkey	2. India 3. Argentina	China (1,2,3); EC (3); Malaysia (2); New Zealand (2); Sri Lanka (2); Switzerland (3); Thailand (2)
11 Bound stationery	482010	1. New Zealand	2. U.S.	China (2); EC (2); Korea (2); Malaysia (1)
12 Cotton yarn	5205, 5206	1. Turkey (SG)	2. Peru (SG)	All because SG
13 Polyester yarn	540233	1. Turkey	2. Argentina	China (1,2); Indonesia (1,2); India (2); Malaysia (1); Taiwan (2); Thailand (1)
14 Polyester fibre	550320	1. Pakistan	2. Argentina 3. South Africa	China (1,2,3); India (2); Indonesia (2); Taiwan (2)
15 Artificial staple fibers of rayon	550410	1. Brazil	2. India	China (1,2); Indonesia (1,2); EC (1); Taiwan (1); Thailand (1)
16 Certain yarn	550931, 550932	1. Turkey	2. Argentina	Indonesia (1,2); Brazil (2); China (1); India (1)
Certain yarn	551011	1. Turkey	2. Brazil	China (1,2); Indonesia (1,2); India (1,2); EC (2); Taiwan (2); Thailand (2)
17 Blankets and traveling rugs	630140	1. Brazil	2. Egypt (SG)	China (1)
18 Footwear	640219, 640291, 640319, 640340, 640391, 640411, 640419	1. Brazil	2. Canada 3. Argentina	China (1,2,3); Vietnam (2)
Footwear	640212, 640220, 640299, 640312, 640320, 640351, 640359, 640399,	1. Brazil	2. Argentina	China (1,2)

	Footwear	640510, 640520, 640590 640110, 640192, 640199	1. Canada	2. Argentina	China (1,2); Vietnam (1)
19	Ceramic tiles (unglazed) Ceramic tiles (glazed)	690790 690890	1. Ecuador (CSG) 1. Ecuador (CSG)	2. Jordan (SG) 2. India 3. Morocco (SG) 4. Jordan (SG)	China (1) China (1,2)
20	Tableware and kitchenware	691110, 691200	1. Ecuador (CSG)	2. Argentina	China (1,2)
21	Wire of iron or nonalloy steel	721710	1. EC	2. Indonesia (SG)	China (1)
22	Flat-rolled products of stainless steel	721931, 721932, 721933, 721934, 721935	1. EC	2. India	China (1,2); Korea (1,2); Taiwan (1,2); Japan (2); EC (2); South Africa (2); Thailand (2); U.S. (2)
23	Pipes and tubes	730429	1. Canada	2. Ukraine (SG) 3. EC	China (1,3)
	Pipes and tubes	730630	1. U.S.	2. EC 3. Canada 4. Australia	China (1,2,3,4); Belarus (2); Bosnia Herzegovina (2); Malaysia (4); Russia (2)
	Pipes and tubes	730661	1. U.S.	2. EC 3. Australia	China (1,3); Turkey (1,2); Belarus (2); Korea (1); Malaysia (3); Mexico (1); Ukraine (2)
24	Iron or steel chain	731582	1. South Africa	2. Argentina	China (1,2)
25	Iron or steel nails, tacks, pins, corrugated nails, staples	731700	1. U.S.	2. Indonesia (SG)	China (1); UAE (1)
26	Screws and bolts	731815	1. EC	2. U.S.	China (1,2)
27	Aluminum bars, rods and profiles	760421, 760429, 760820	1. South Africa	2. Canada	China (1,2)
28	Aluminum foil	760711	1. EC	2. India (CSG)	China (1,2); Armenia (1); Brazil (1)
29	Heat pumps	841861	1. Argentina	2. Canada	China (2); Malaysia (1); Thailand (1)
30	Refrigerators	841899	1. Canada	2. U.S.	China (1,2)
31	Food grinders, processors and mixers	850940	1. Turkey (SG)	2. Argentina	China (2); Brazil (2)
32	Recordable DVDs and CDs	852340	1. India	2. Brazil (SG) 3. Argentina	China (1); Hong Kong (1); Paraguay (3); Taiwan (1)
33	Articles of graphite	854511	1. U.S.	2. Brazil	China (1,2)
34	Road wheels and parts and accessories thereof	870870	1. Australia	2. Argentina	China (1,2)
35	Parts and accessories of motor vehicles	870899	1. Argentina	2. India	China (1,2)

Source: Compiled by the author from the *Global Antidumping Database*. The table identifies more than 70 distinct 6-digit HS codes with at least two different countries newly initiating trade remedy investigations over the same code between 1Q 2007 and 1Q 2009.

Table 6. WTO Member Antidumping and Countervailing Measures Initiations, Impositions and DSU Challenges, by Targeted WTO Exporter for 1995-2008
