**The World Bank  
DECRG**

\*TRADE WATCH is a monthly note that follows international trade flows from a global perspective. It contains up-to-date trade data from an array of sources along with an analysis from Caroline Freund and Matias David Horenstein, international trade specialists in the Development Economics Research Group, covering issues such as import and export growth at national, regional and industry levels, exchange rate fluctuations and quantity and price decomposition of trade. The goal of the note is to provide high quality and timely information to World Bank units and stakeholders. The analysis is supported by funding from PREM Trade and the governments of Norway, Sweden and the United Kingdom through the Multidonor Trust Fund for Trade and Development.

## APRIL TRADE WATCH

### APRIL TRADE UPDATE – GREECE WEIGHS ON EUROPE

- February stagnates relative to January.
- Financial woes in Greece are reflected in slow trade growth in Europe.
- Sectoral evidence is mixed on recovery in the US and Japan.

*February data little changed from January.* Tables 1 and 2 show seasonally adjusted export and import growth, respectively,<sup>1</sup> using 8 years of monthly trade data in constant dollars for 50 countries. February data show no substantial change in trade. March data for a handful of countries indicates some improvement. These data continue to highlight three key downside risks to the trade recovery. The first is that restocking is nearly complete and will not contribute to trade growth as it did in mid-late 2009; the second is that growth effects of the global stimulus are waning and we may see trade levels stabilize with little growth, and the third is that financial problems in Europe could spread leading to a decline in trade growth.

To reduce volatility in monthly figures, three-month average growth rates by region are shown in Figures 1 and 2.<sup>2</sup> The dark bars represent the most recent three-month growth rate, and the lighter bars show the previous three-month growth rate. East Asia and the Pacific show robust growth that has been on track for six months now. Latin America and North America record steady growth. Europe shows a sharp drop in export growth in recent months, as a second round of financial concerns have arisen. Highlighting this effect Greece currently report the weakest trade growth of the sample countries (Figures 3 and 4). South Asia shows strong import growth, largely because of India. (Growth rates of individual countries are shown in Figures 3 and 4.)

Trade fell fast and furiously across countries since the onset of the financial crisis in the fall. Figure 5 compares trade growth (month over same month the previous year) in this crisis and in previous downturns (1975, 1982, 1991, and 2001), using monthly data in constant U.S. dollars for a balanced sample of 31 countries that report data from January 1960 through February 2010. Data are matched so that year zero is the lowest point of the contraction. Growth leading up to the crisis was higher and the fall deeper in this episode than in previous downturns. Of special interest, the recovery also appears to be much steeper in this crisis than in previous episodes. The graph shows a V-shaped recovery.

Figure 6 shows that trade has been recovering at almost twice the growth rate of the 2002-2008 period and increased almost 20 percent since its lowest point in February 2009. While the recovery is impressive, trade value remains around 30 percent lower than the pre-crisis level and 50 percent lower than what it would have been if the world

---

<sup>1</sup> We converted nominal trade to year's 2000 constant dollars growth and deseasonalized using country-month fixed effects.

<sup>2</sup> Africa and the Middle East are not included because there are not enough countries reporting data for credible statistics.

## APRIL TRADE WATCH

economy would have continued to grow at the same rate of the 2002-2008 period. In addition, the figure shows the stagnation of trade in recent months.

U.S. and Japanese data, available by industry, provide an indication of where trade is declining/recovering the fastest. Table 3 shows U.S. import growth by broad sector relative to the same quarter of the previous year and recent data for January and February. Similar data for Japan (measured in Yen) are shown in Table 4.<sup>3</sup> In both countries, January (column 7) data show improvement across sectors as compared with Q4 2009, but this is largely due to the sharp decline in trade that occurred in January 2009. The last column shows January-February 2010 relative to January-February 2008, to examine how the pattern of trade now compares with its structure when trade was booming. In the United States, vegetables, food, chemicals, and footwear are now closest to their pre-crisis levels; while metals, wood, minerals, and transportation remain over 20 percent below 2008 levels. In Japan, all sectors remain quite depressed with chemicals, footgear, foodstuffs, and textiles doing relatively better. Thus, the results point to significant improvements from early 2009, but large deficits in important sectors continue to point to potential uncertainty in the recovery.

*If you wish to receive a monthly **Trade Watch**, email [mhorenstein@worldbank.org](mailto:mhorenstein@worldbank.org) with "Trade Watch" in the subject. For previous notes and more trade statistics visit the Trade Watch webpage at <http://www.worldbank.org/research/trade/>*

---

<sup>3</sup> Aggregate figures for Japan in Table 6 are calculated from Yen values and therefore are different from Tables 1 and 2, which use data in \$US.
